### ABSTRACT

---

In this study 34 species of Rotifera, 9 species of Cladocera and 1 species of Copepoda have been observed during the study between May 2007-May 2008 from Kızılırmak River, Delice, Kılıçözü, Malaközü and Budaközü Streams in the Kızılırmak River Basin in Turkey. During the study *Brachionus*, *Lecane*, *Cephalodella* belongs to Rotifera; *Bosmina longirostris* and *Cydorus sphaericus* belongs to Cladocera and *Eucyclops serrulatus* belong to Copepoda were the commonest genera and species. Also *Asplanchna priodonta*, *Brachionus quadridentatus*, *Brachionus calyciflorus*, *Euchlanis dilatata* and *Synchaeta pectinata* were the annual species.

### Key Words

Zooplankton, Seasonal distribution, Kızılırmak River Basin

---

### ÖZET

---

Kızılırmak Nehir Havzası, Delice, Kılıçözü, Malaközü ve Budaközü derelerinde Mayıs 2007-Mayıs 2008 döneminde yapılan çalışmada Rotifera'dan 34 tür, Cladocera'dan 9 tür ve Copepoda'dan 1 tür tespit edilmiştir. Çalışmada Rotifere'ya ait *Brachionus*, *Lecane*, *Cephalodella* Cladocera ya ait *Bosmina longirostris* ve Copepoda'ya ait *Cydorus sphaericus* *Eucyclops serrulatus* en yaygın görülen türler olmuştur. Aynı zamanda *Asplanchna priodonta*, *Brachionus quadridentatus*, *Brachionus calyciflorus*, *Euchlanis dilatata* and *Synchaeta pectinata* yıl boyu gözlenen türler olmuştur.

### Anahtar Kelimeler

Zooplankton, Mevsimsel Dağılım, Kızılırmak Nehir Havzası

## INTRODUCTION

Although a lot of studies have been done on the zooplanktonic organisms, a few of them on the riverine zooplankton. These studies have been increased recently according to Water Framework Directive after the year of 2000.

The last checklist on Rotifers prepared by Ustaoglu et al. [1] reported 341 rotifer taxa in Turkey and until now 93 species belong to Cladocera and 106 species belongs to Copepoda were identified [2-6].

There were no zooplankton study have been done on the Delice River and arms. Some studies are available in the near area. Yiğit and Altındağ [7], were determined totally 32 zooplankton species which of them 19 belongs to Rotifera; 9 belongs to Cladocera and 4 belongs to Copepoda in Hirfanlı Dam. Also Baykal et al. [8] were investigated the relationship between phytoplankton and zooplankton density in Hirfanlı Dam Lake too.

## MATERIALS AND METHODS

Samples were collected monthly from 10 different localities during May 2007-May 2008 using a standard plankton net (mesh diameter 44 µm) and fixed with formaldehyde [9] The rotifer species were identified according to [10-17]. Cladocera

species were identified according to [18-22] For the copepoda [23,24] references have been used.

## RESULTS AND DISCUSSION

Samples from 10 freshwater sites in Kızılırmak river basin yielded 44 zooplankton species which of them 34 belongs to Rotifera; 9 belong to Cladocera and 1 species belong to Copepoda. (Table 1 and Table 2). The monthly distribution of the zooplankton species have been given in the Table 3-5 and also their distribution according to the stream locality have been given on the Table 6.

During the study Rotifera species number were higher than the other zooplankton due to their short generation time and high adaptation to different ecological condition [25]. Among rotifers some cosmopolitan genera like *Brachionus* (5 species), *Lecane* (4 species) and *Cephalodella* (4 species) were observed during the year.

Acharya et al [26] were observed that with smaller body cladoceran like *Bosmina* were highly abundant in the rivers generally. In the study area *Bosmina longirostris* was also abundant species while *Ceriodaphnia reticulata*, *Simocephalus vetulus*, *Alona rectangula* and *Scapholeberis kingi* were occurred only in May 2007; *Moina micrura* was observed only in september 2007 and *Macrothrix*

<b>COPEPODA</b>					
<i>Eucyclops serrulatus</i>	+	+			

*laticornis* was occurred only in November 2007 samples. In the Copepods *Eucyclops serrulatus* was only one species. Most of the specimens were naupliar stages and copepodits due to high predation pressure on the bigger zooplanktonic organisms in the rivers too [27].

Güher [28] identified 21 Cladocera, in the 18 different localities in the Thrace Region; Bozkurt et al [29] observed 36 rotifera in the Asi River and *Brachionus* (8 species) was the dominant species like Kızılırmak Basin. Bozkurt [30] was identified 46 species of rotifers, 14 species of Cladocera and 8 species of Copepoda in 6 different rivers in Mediterranean. Among them *Lecane* (9 species), *Brachionus* (5 species), *Trichocerca* (4 species) and *Keratella* (4 species) also *B. longirostris* were the common species and genera.

Akbulut and Yıldız [31] were observed 40 rotifera species in the 5 different localities from Euphrates River Basin, and *Brachionus* (6 species) *Lecane* (5 species) were the abundant genera and species the same as our study results. Göksu et al [32] were identified totally 22 zooplankton species 15 belongs to Cladocera and 7 belongs to Copepoda and *B. longirostris* was dominant cladoceran species like in the Kızılırmak Basin

According to the studies *Brachionus*, *Keratella* and *Lecane* were the common genera in Turkish freshwater [33] During the study *Brachionus*, *Lecane* and *Cephalodella* were common genera subsequently. During the study Identified cladoceran species were also most common species according to the studies of [2,34,28,35,30,32] *Eucyclops serrulatus* was only one species which is identified from study area is also cosmopolitan species [36] This species was observed in the Gediz River [35] Edirne, Tekirdağ and Kırklareli [37].

## ACKNOWLEDGEMENTS

This study is supported by H.U. Research Fund as MSc Thesis of Selgün Günsel (07D06601001). The authors gratefully thank to financial support.
